

SIMPLE IOS PROGRAMMING CHALLENGE

An intern has started a simple application. The task has fallen to you to complete this application.

The application takes in a person's basic information, and emails it.

Task List:

- **Fix any memory problems**, the application should not leak memory or crash. This application does **NOT** use ARC.
- Add **Middle Name, Surname, Address** and **Telephone** number to the information captured, the user should be able to move through the form with the keyboard "**Next**" button
- Ensure that the application works correctly in **Portrait** and **Landscape** orientation, some initial testers reported the text field is hard to tap.
- **Send** the captured information via email, to aliosteam@iggroup.com

Notes: This is a simple test and will be a straightforward task, we are looking for the ability to follow existing coding conventions, attention to detail as well as the usability of the UI.
